Bank Account Management in Python

This Python project implements a Bank Account Management System using object-oriented programming principles to manage user accounts. The system allows users to perform key operations like creating and deleting accounts, depositing and withdrawing funds, viewing account balances, and listing all accounts. It employs the BankAccount class to encapsulate account details and operations, while file handling ensures persistent storage of account data and transaction logs. The program incorporates input validation and error handling for robustness and a menu-driven interface for user interaction. It highlights Python concepts such as classes, functions, lists, file handling, and exception management.
